Module 5
Water Systems
CLIMATE IMPACTS & ADAPTATION STRATEGIES FOR MUNICIPAL WATER SYSTEMS
Overview

1. Current and future challenges
2. Adaptation strategies
   • Issues to consider
   • Stormwater control measures (SCMs)
   • Flood prevention
   • Wetlands
   • Drainage and conveyance
   • Inflow & infiltration prevention
   • CSO management
3. Case studies
Current and future challenges

CURRENT CHALLENGES

& PROJECTED CLIMATE IMPACTS
Current and future challenges

Current management challenges

Issues that we’re already dealing with:

- Aging collection and distribution infrastructure
  - Over 70% of systems in US Midwest and Northeast are over 40 years old

- Urban population growth and sprawl
  - Lack of impervious surfaces
  - Combined sewer & stormwater overflows

Today’s challenges will be exacerbated by climate change in the coming years
Current and future challenges
Climate change projections: Increase in heavy rainfall

**HIGHER ANNUAL AVERAGE PRECIPITATION**

**INCREASE IN DAYS WITH HEAVY PRECIPITATION**

Projected changes 2041-2070 relative to 1971-2000: Increase in heavy precipitation

Image source (left): National Climate Assessment 2014, Figure 18.6 “When it rains, it pours”; (right) EPA Climate Ready Water Utilities, “Midwest” (page 42)
Current and future challenges

Climate change projections: Increased likelihood of droughts

**BOTH WET AND DRY PERIODS INCREASE**

**PROJECTED CHANGES INCLUDE VARIABILITY IN WATER SUPPLY IN GREAT LAKES REGION**

Frequency of both droughts and flooding are expected to increase.

Between heavy rainfall, longer periods without precipitation.

Increasing air temperature + changes in evaporation and evapotranspiration → more variability of water supply in region.

Current and future challenges
Implications for local government

IMPACTS ON WATER INFRASTRUCTURE:
Original systems designed for past climate extremes, which do not represent future (nor even current) conditions. This can lead to:

• Shorter life span of systems
• Increase in maintenance and operating costs
• More frequent and intense CSOs and sewage treatment plant overloads

SECONDARY IMPACTS:

• Disruption to additional municipal operations and services
• Flood related damage to private and public property; business disruption
• Evacuation, relocation, homelessness
• Flood related damage to urban ecosystems
• Increase in insurance costs and liability among municipalities

Bottom line: Without appropriate adaptation measures, municipalities may be faced with severe and unanticipated economic losses and public health crises due to damaged or overwhelmed storm water and waste water systems
Current and future challenges
In the news: Water quality compromised in Lake Erie

CLIMATE CHANGE & INCREASED RUNOFF TRIGGERING POTENTIALLY TOXIC BLOOMS

- Algae and bacteria responsible for blooms need warm temperature and phosphorous + nitrogen to grow. Climate change creating warmer waters.

- Some blooms (such as the one in Toledo in 2014) can produce toxins that produce neurological problems like paralysis and seizures in people.

- When blooms die, bacteria feasting on decaying matter can result in ecological dead zones.

- Municipalities forced to deal with compounding factors: stormwater runoff, increasing temperatures, agricultural activity, etc

Climate Impact & Risk Assessment Resources:

**Climate Resilience Evaluation & Awareness Tool (CREAT)**
Software tool created by the EPA to assist drinking water and wastewater utilities in understanding potential climate change threats and evaluating adaptation options. Free of charge.

**EPA National Stormwater Calculator**
Desktop application that estimates the annual amount of rainwater and frequency of runoff from a specific site anywhere in the United States. Estimates are based on local soil conditions, land cover, and historic rainfall records.

**National Climate Assessment 2014: Midwest**

- “Key Message 5: Increased Rainfall and Flooding”
Adaptation strategies

STORMWATER MANAGEMENT WITH BIOSWALES

The landscaping throughout this parking lot serves multiple purposes. When it rains, contaminants from cars in the parking lot wash into the bioswales (landscaped areas), where the soils and plants work to remove toxins before they enter the storm water system. By filtering through the soil, the bioswales also work to regulate the rate at which rainwater from the site enters the storm water system, thus diminishing our contribution to flooding. Lastly, the bioswales help reduce the heat island effect (increased ambient temperature) by using materials exposed to the sun of the parking lot.
Adaptation strategies

Issues to consider

• “No regrets” strategies: Look for secondary social, economic, and environmental benefits

• Find the right balance between upsizing “grey” infrastructure (pipes, overflow sites, treatment plants) and implementing “green” infrastructure
  • More info: The Value of Green Infrastructure – Center for Neighborhood Technology

Important: There will never be enough capacity in municipal stormwater systems to completely capture all extreme events. Municipalities now deploying complementary strategies that lighten the burden on traditional systems.
Adaptation strategies
Stormwater control measures (SCMs)

SCMs:

• Reduce runoff volume and peak flows
• Remove pollutants from runoff
• Can be:
  • **Structural**: any facility constructed to mitigate the adverse impacts of stormwater and urban runoff pollution
  • **Non-structural**: planning and design approaches that limit imperviousness and reduce stormwater and urban runoff pollution

*Image*: Bioswale in a municipal parking lot in Mt Clemens, MI
Adaptation strategies
SCMs: Best Practices

• SCM implementation works best when designed as a system incorporating both structural and non-structural SCMs on a regional or watershed scale

• Consider nonstructural SCMs before structural practices. Land use planning can reduce runoff and, thus, the need for structural SCMs

• SCMs that harvest, infiltrate, and evapotranspirate stormwater are critical to reducing the volume and pollutant load of small storms
### Adaptation strategies

**SCMs: Summary of structural strategies**

<table>
<thead>
<tr>
<th>SCM</th>
<th>What it accomplishes</th>
<th>What it replaces</th>
<th>How it works</th>

Flood prevention: Know your risks and vulnerabilities

- Define historic and projected precipitation rates
- Use maps to spatially define vulnerabilities:
  - Estimate future financial losses due to flood damages
- Structural flood prevention, e.g. Bio-retention practices, permeable pavement, water conveyance and drainage
- Non-structural flood prevention. E.g. Planning measures to direct growth to less vulnerable areas; Conservation easements; wetlands protection

Resources:
- NOAA Coastal County Snapshots
- NOAA Critical Facilities Flood Exposure Tool
- EPA National Stormwater Calculator
- FEMA HAZUS
## Adaptation strategies

**Wetlands help manage water quantity and quality**

### WETLANDS PROVIDE MANY STORMWATER MANAGEMENT SERVICES:
- Reduce peak flows by delaying/storing water
- Detain polluted floodwaters and improve their quality
- Stabilize shorelines and buffer against storm surges

### CLIMATE CHANGE IMPACTS ON WETLANDS:
- Earlier ice-out and snow melt, lower summer lake levels, and more intense flooding threaten wildlife cycles and water quantity/quality in wetlands
- Smaller, isolated, rainfall-dependent inland wetlands are most threatened

### NEARLY TWO THIRDS OF WETLANDS IN GREAT LAKES BASIN HAVE BEEN DESTROYED

Efforts should focus on protecting AND revegetating wetlands:
- Select native species that are able to withstand warmer temperatures, frequent floods, and droughts
- Restore or maintain connection between lakes and rivers
- Implement water conservation and development regulation designed to minimize landscape fragmentation
Adaptation strategies
Inflow and infiltration (I&I) prevention

REDDUCING I&I REQUIRES CONSTANT VIGILANCE AND VARIOUS METHODS:

- Manhole testing with low-pressure air and vacuum tests
- Inspection via closed circuit television (CCTV)
- Flow monitoring
- Focused electrode leak location system (FELL)

Information source: Water & Wastes Digest, Preventing I&I; RedZone Robotics, Sewer Inflow & Infiltration
Image source: NPCA, Vacuum Testing Backfilled Manholes
Adaptation strategies
Water conveyance and drainage

• Increase capacity of downstream systems to carry increased runoff

• Design to take advantage of natural systems

• Improvements can include:
  • Replacing existing pipes and storm systems with larger facilities
  • Armoring to prevent erosion
  • Removing debris
  • Installing smooth liners that reduce channel friction and increase capacity

However, these measures do not address water quality threats! They should be paired with SCMs.

Image source: Amy Greene Environmental Consultants
Adaptation strategies
CSO Management

- Separate stormwater conveyance system from wastewater conveyance system
- Build a CSO storage facility
- Build a screening & disinfection facility
- Install a retention treatment system
- Reduce amount of stormwater runoff through stormwater control measures (SCMs or Green Infrastructure)

Grand Rapids CSS Separation:
- City was issued long term CSO control program by State of MI in 1988
- Goal: Eliminate all CSOs by 2019

Increasing cost
- By 2011, 99% of all the city’s CSO volume was eliminated at a cost of $360M
- Costs are reflected in Grand Rapids’ sewer rates
Adaptation strategies
Engaging homeowners and businesses

Most property is privately owned--it’s critical to engage private property owners in becoming part of the solution.

- **Rain Ready for Homeowners**
  Home assessment, insurance, yard improvements, etc

- **Stormwater Communications Toolkit**
  Useful guide that includes sample talking points, “everyday terms”, and sample fact sheets

Example programs focusing on property owners:

- **Huron River Watershed Council**: Work with neighborhood residents to implement low-impact development techniques

- **Superior, WI Stormwater Flood Control Program**: free site inspection, $150 grants for service lateral inspection, free backwater valve installation

- **Milwaukee, WI**: adoption of stormwater management fee based on amount of impervious surface
**Stormwater Management Resources:**

- **EPA System for Urban Stormwater Treatment and Analysis Integration (SUSTAIN)** (Complex model)
  Decision support system to assist stormwater management professionals in developing implementation plans for flow and pollution control to protect source waters and meet water quality goals.

- **GLSLCI: Stormwater Management in the Great Lakes & St Lawrence Basin**
  Report focusing on specific stormwater practices in the Great Lakes and St Lawrence watershed.

- **EPA Green Infrastructure**
  EPA tools, case studies, and researches on green infrastructure.

- **NRDC: How Water Ready is Your State or City?**
  Interactive map that displays risks and readiness actions by state.

- **Rain Ready**
  CNT’s RainReady initiative helps.

- **WERF Whole Life Costing Models**
  The models provide a framework for calculating capital and long-term maintenance costs of individual best management practices and low impact development techniques.
Case Study

MILWAUKEE, WI

Other Resources

• **EPA Climate Ready Water Utilities Toolbox** (CRWU)
  CRWU Toolbox provides access to resources containing climate-related information relevant to the water sector, including activities, funding information, reports, models, and seminars.

• **EPA Adaptation Strategies Guide for Water Utilities**
  The guide provides adaptation options for drinking water, wastewater, and stormwater utilities based on region and projected climate impacts.

• **Climate Adaptation Knowledge Exchange (CakeX)**
  Hared knowledge base for managing natural and built systems in the face of rapid climate change. Just as importantly, it is intended to help build an innovative community of practice. Features extensive case study library and tools.
